

Complete this worksheet and have it checked next day for homework completion

There are several types of mutation:

DELETION (a base is lost)

INSERTION (an extra base is inserted)

Deletion and insertion may cause what's called a **FRAMESHIFT**, meaning the reading "frame" changes, changing the amino acid sequence.

POINT MUTATION (one base is changed)

If a substitution *changes* the amino acid, it's called a **MISSENSE** mutation.

If a substitution *does not change* the amino acid, it's called a **SILENT** mutation.

If a substitution *changes the amino acid to a "stop,"* it's called a **NONSENSE** mutation.

→ Complete the boxes below. Classify each as either Deletion, Insertion, or Substitution **AND** as either frameshift, missense, silent or nonsense (hint: deletion or insertion will always be frameshift).

Original DNA Sequence: 5' T A C A C C T T G G C G A C G A C T 3'

mRNA Sequence:

Amino Acid Sequence:

Mutated DNA Sequence #1: 5' T A C A T C T T G G C G A C G A C T 3'

What's the mRNA sequence? _____ (Circle the change)

What will be the amino acid sequence? _____

Will there likely be effects? _____ What kind of mutation is this? _____

Mutated DNA Sequence #2: 5' T A C G A C C T T G G C G A C G A C T 3'

What's the mRNA sequence? _____ (Circle the change)

What will be the amino acid sequence? _____

Will there likely be effects? _____ What kind of mutation is this? _____

Mutated DNA Sequence #3: T A C A C C T T A G C G A C G A C T

What's the mRNA sequence? _____ (Circle the change)

What will be the amino acid sequence? _____

Will there likely be effects? _____ What kind of mutation is this? _____

Mutated DNA Sequence #4: T A C A C C T T G G C G A C T A C T

What's the mRNA sequence? _____ (Circle the change)

What will be the amino acid sequence? _____

Will there likely be effects? _____ What kind of mutation is this? _____

Original DNA Sequence: T A C A C C T T G G C G A C G A C T

mRNA Sequence: _____

Amino Acid Sequence: _____

Mutated DNA Sequence #5: T A C A C C T T G G G A C G A C T

What will be the corresponding mRNA sequence? _____

What will be the amino acid sequence? _____

Will there likely be effects? _____ What kind of mutation is this? _____

1. Which type of mutation is responsible for new variations of a trait? _____
2. Which type of mutation results in abnormal amino acid sequence? _____
3. Which type of mutation stops the translation of the mRNA? _____

Sickle Cell Anemia

Sickle cell anemia is the result of a type of mutation in the gene that codes for part of the hemoglobin molecule. Recall that hemoglobin carries oxygen in your red blood cells. The mutation causes the red blood cells to become stiff and sickle-shaped when they release their oxygen. The sickled cells tend to get stuck in blood vessels, causing pain and increased risk of stroke, blindness, damage to the heart and lungs, and other conditions.

Analyze the DNA strands below to determine what amino acid is changed and what type of mutation occurred.

Normal hemoglobin DNA C A C G T G G A C T G A G G A C T C C T C

Normal hemoglobin mRNA _____

Normal hemoglobin A.A. sequence _____

Sickle cell hemoglobin DNA **C A C G T G G A C T G A G G A C A C C T C**

Sickle cell hemoglobin mRNA _____

Sickle cell hemoglobin A.A. sequence _____
